Uniprot简介

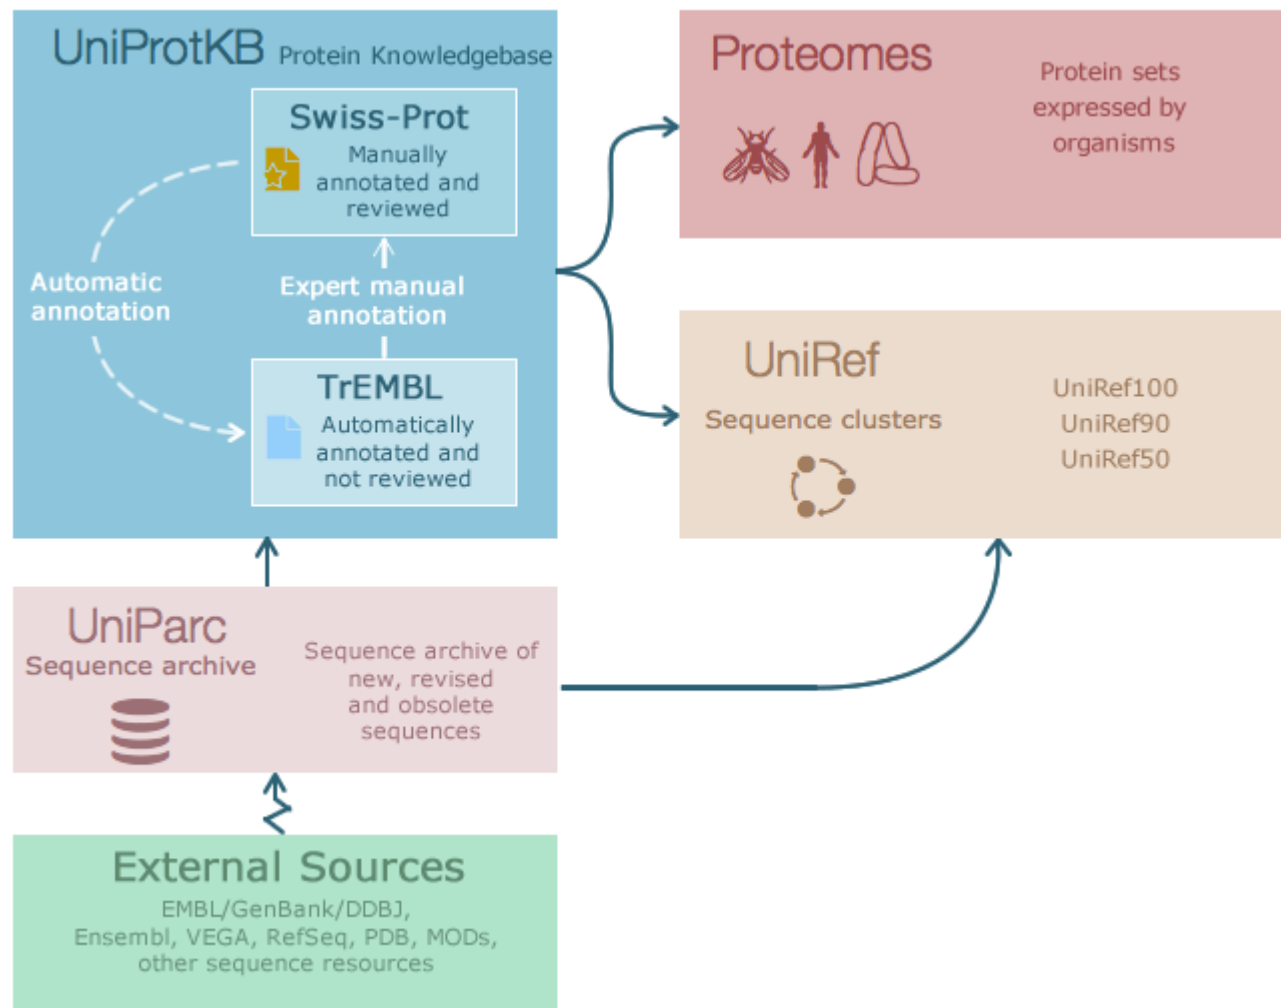

- 全称: The Universal Protein Resource
- The mission of UniProt is to provide the scientific community with a comprehensive, high-quality and freely accessible resource of **protein sequence and functional information**.
- 合作单位:
 - the European Bioinformatics Institute (EMBL-EBI),
 - the SIB Swiss Institute of Bioinformatics
 - the Protein Information Resource (PIR)

Uniprot简介

- 包含:

- 1) UniProt Knowledgebase (UniProtKB),
- 2) UniProt Reference Clusters (UniRef),
- 3) UniProt Archive (UniParc)

1) The UniProt Knowledgebase (UniProtKB)

- The centerpiece of the UniProt Consortium's activity
- 包含:
 - UniProtKB/Swiss-Prot:
contains high-quality **manually annotated** and non-redundant protein sequence records
 - UniProtKB/TrEMBL
contains high-quality **computationally analyzed** records enriched with automatic annotation and classification
- 序列来源:
 - DDBJ/ENA/GenBank coding sequence (CDS) translations
 - the sequences of PDB structures
 - sequences from Ensembl and RefSeq
 - data derived from amino acid sequences that are directly submitted to UniProtKB or scanned from the literature.

2) UniProt Reference Clusters (UniRef)

- Three UniRef databases – UniRef100, UniRef90 and UniRef50 – merge sequences automatically across species.
- chicken, cow, dog, fly, Fugu, human, mouse, rat, Tetraodon, Xenopus and zebrafish
- UniRef90 and UniRef50 are built from UniRef100 to provide records with mutual sequence identity of 90% or more, or 50% or more, respectively, with links to the corresponding UniProtKB records.

3) UniProt Archive (UniParc)

- UniParc is designed to capture all publicly available protein sequence data and contains all the protein sequences from the main publicly available protein sequence databases
- 大型容纳器

Sources of annotation for the UniProt Knowledgebase.

Different databases for different uses

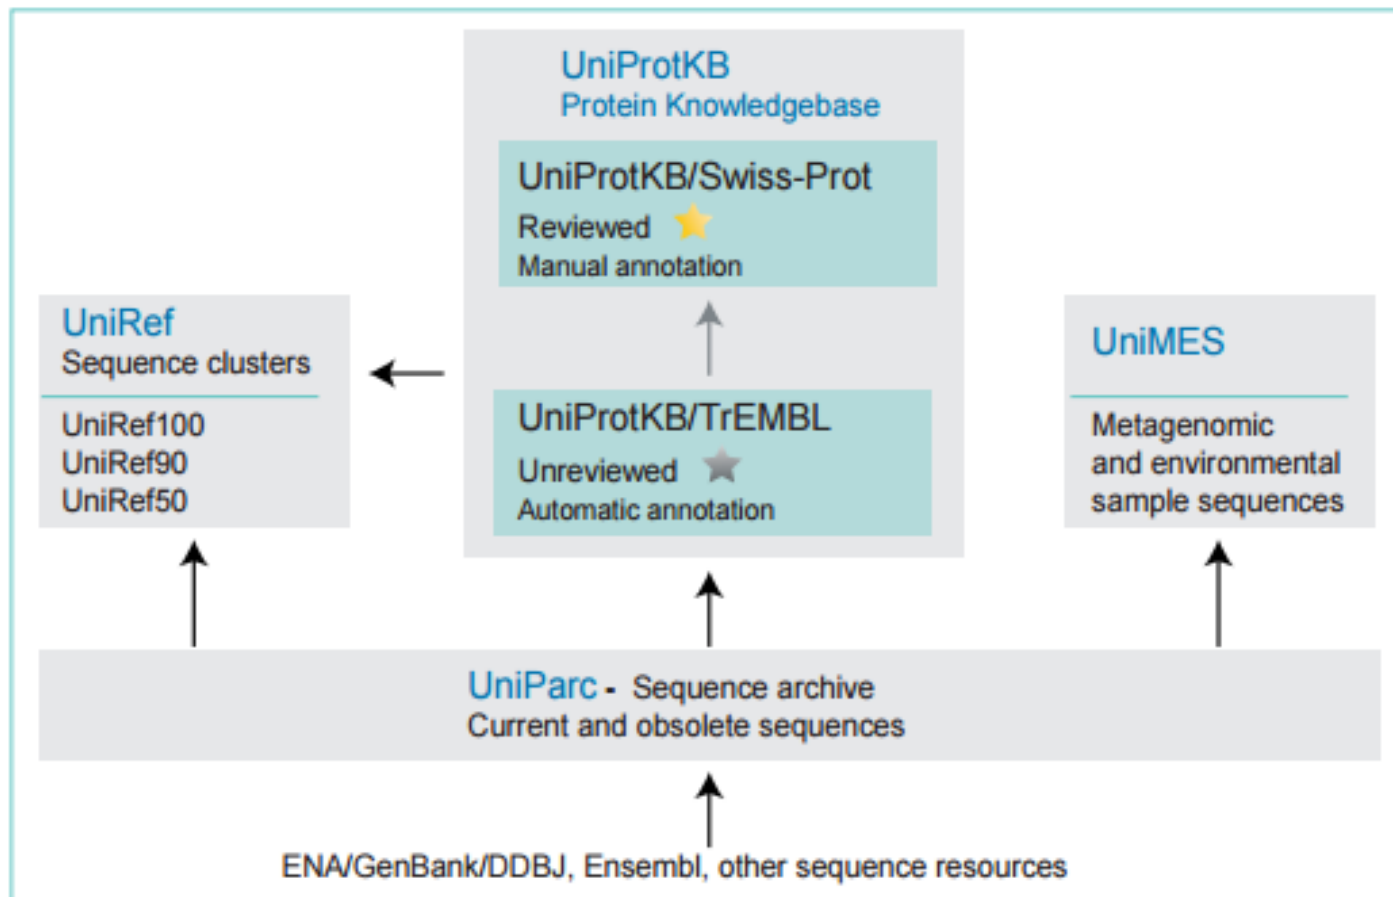

- The UniProt Knowledgebase → access **functional information** on proteins
 - Each entry contains:
 - The amino acid sequence
 - Protein name or description
 - Taxonomic data
 - Citation information
 - Biological ontology, classification, and cross-references
 -

Different databases for different uses

- The UniRef databases
 - → provide clustered sets of sequences (依据序列相似度)
 - → provide complete coverage of sequence space at **several resolutions**
- UniParc :
 - → **the most comprehensive** publicly accessible non-redundant protein sequence database available, providing links to all underlying sources and versions of these sequences

Protein spotlight

The Shape Of Harm
May 2016

Sometimes we are forced to see things differently. But it is never easy because we are creatures of habit and, like it or not, shackled by what we were first led to believe. This is exactly what happened with the prion. Prions are proteins whose shape can change under certain conditions, and in so doing be at the heart of fatal diseases...

检索方式

1. 文字检索
2. 序列相似形检索 (Blast)

通过文字检索

- 1) 选定要采用的数据库

The screenshot shows the UniProt website interface. At the top, there is a search bar with a 'Search' button and a 'Help' link. Below the search bar, there is a navigation menu with links to 'BLAST', 'Align', and 'Retrieve/ID mapping'. The main content area is divided into several sections:

- UniProtKB** (highlighted with a red box): Protein knowledgebase
- UniRef**: Sequence clusters
- Supporting data**: Select one of the options below to target your search:
 - Literature citations
 - Taxonomy
 - Keywords
 - Subcellular locations
 - Cross-referenced databases
 - Human diseases
 - Statistics
- UniParc**: Sequence archive
- Proteomes**: Protein sets from fully sequenced genomes
- Annotation systems**: Systems used to automatically annotate proteins with high accuracy:
 - UniRule (Manually curated rules)
 - SAAS (System generated rules)
- Help**: Help pages, FAQs, UniProtKB manual, documents, news archive and Biocuration projects.

On the left side, there is a sidebar with the UniProt logo and the text 'The mission of UniProt is to provide'. Below this, there is a section for 'UniProtKB' with the text 'UniProt Knowledgebase' and 'Swiss-Prot (551,385) Manually annotated and reviewed.'.

当选定了不同的子数据库后，搜索条的背景颜色会相应的做出改变，以提醒用户。

通过文字检索

2) 键入关键词

A screenshot of the UniProt search interface. The UniProt logo is on the left. A search bar contains the text "UniProtKB" with a dropdown arrow and "tp53". To the right of the search bar is a link to "Advanced" with a dropdown arrow, and a "Search" button with a magnifying glass icon.

Protein | Cellular tumor antigen p53

Gene | TP53

Organism | *Homo sapiens* (Human)Status |  Reviewed - Annotation score:  - Experimental evidence at protein levelⁱFunctionⁱ

Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bcl-2 expression. In cooperation with mitochondrial PPIF is involved in activating oxidative stress-induced necrosis; the function is largely independent of transcription. Induces the transcription of long intergenic non-coding RNA p21 (lincRNA-p21) and lincRNA-Mkln1. LincRNA-p21 participates in TP53-dependent transcriptional repression leading to apoptosis and seem to have to effect on cell-cycle regulation. Implicated in Notch signaling cross-over. Prevents CDK7 kinase activity when associated to CAK complex in response to DNA damage, thus stopping cell cycle progression. Isoform 2 enhances the transactivation activity of isoform 1 from some but not all TP53-inducible promoters. Isoform 4 suppresses transactivation activity and impairs growth suppression mediated by isoform 1. Isoform 7 inhibits isoform 1-mediated apoptosis. Regulates the circadian clock by repressing CLOCK-ARNTL/BMAL1-mediated transcriptional activation of PER2 (PubMed:24051492).  12 Publications

Involvement in diseaseⁱ

TP53 is found in increased amounts in a wide variety of transformed cells. TP53 is frequently mutated or inactivated in about 60% of cancers. TP53 defects are found in Barrett metaplasia a condition in which the normally stratified squamous epithelium of the lower esophagus is replaced by a metaplastic columnar epithelium. The condition develops as a complication in approximately 10% of patients with chronic gastroesophageal reflux disease and predisposes to the development of esophageal adenocarcinoma.

Esophageal cancer (ESCR)

The disease is caused by mutations affecting the gene represented in this entry.

Disease description: A malignancy of the esophagus. The most common types are esophageal squamous cell carcinoma and adenocarcinoma. Esophageal cancer remains a devastating disease because it is usually not detected until it has progressed to an advanced incurable stage.

See also OMIM:133239

Li-Fraumeni syndrome (LFS) 9 Publications ▼

The disease is caused by mutations affecting the gene represented in this entry.

Disease description: Autosomal dominant familial cancer syndrome that in its classic form is defined by the existence of a proband affected with a first degree relative affected by any tumor before 45 years and another first degree relative with any tumor before 45 years or a second degree relative with any tumor before 45 years. Alternative definitions for LFS have been proposed (PubMed:8118819 and PubMed:8718514) and called Li-Fraumeni like syndrome (LFL). In these families, a diverse set of malignancies at unusually early ages. Four types of cancers account for 80% of tumors occurring in TP53 germline mutation carriers: soft tissue and bone sarcomas, brain tumors (astrocytomas) and adrenocortical carcinomas. Less frequent tumors include choroid plexus carcinoma, osteosarcoma before the age of 15, rhabdomyosarcoma before the age of 5, leukemia, Wilms tumor, malignant phyllodes tumor, colorectal and gastric cancers.

BLAST

How to use this tool

The Basic Local Alignment Search Tool (BLAST) finds regions of local similarity between sequences, which can be used to infer functional and evolutionary relationships between sequences as well as help identify members of gene families.

1. Enter either a protein or nucleotide sequence or a UniProt identifier (e.g.P00750 or A4_HUMAN or UPI0000000001) into the form field.
2. Optionally, change the program parameters with the dropdown menus under the form.
3. Click the *Run BLAST* button.

Part2

An Information Portal to 119480 Biological Macromolecular Structures

PDB 简介

- An Information Portal to 119480 Biological Macromolecular Structures
- 内容：
 - 3D shapes of proteins, nucleic acids, and complex assemblies that helps students and researchers understand all aspects of biomedicine and agriculture, from protein synthesis to health and disease.
- 数据来源：
 - Structural biologists use methods such as [X-ray crystallography, NMR spectroscopy, and cryo-electron microscopy](#) to determine the location of each atom relative to each other in the molecule. They then deposit this information, which is then annotated and publicly released into the archive by the wwPDB.

Analyze Options

Sequence & Structure Alignment

RCSB PDB's Comparison Tool calculates pairwise sequence (blast2seq, Needleman-Wunsch, and Smith-Waterman) and structure alignments (FATCAT, CE, Mammoth, TM-Align, TopMatch).

Comparisons can be made for any protein in the PDB archive and for [customized](#) or [local files](#) not in the PDB. Special features include support for both rigid-body and flexible alignments and detection of circular permutations.

Enter First PDB ID	↔	Enter Second PDB ID
Select Associated Chain ID ...		Select Associated Chain ID ...
- Select Comparison Method -	Align	More Options

Map Genomic Position to Protein Sequence and 3D Structure

This analysis tool **highlights** the location of a gene position of the human genome on protein sequence and 3D structure. 

Note: For looking up gene names, please use the top-bar search (example: [BRCA1](#)).

Cancer

cells growing without controls

Cells in our bodies are carefully regulated so that they divide, grow, and die according to the best plan for keeping us alive. When they lose these controls, they can grow into deadly cancers. Atomic structures have revealed how cell growth is normally controlled, and how cancer cells circumvent these essential controls.

Major Histocompatibility Complex

总结

- Uniprot 存储了丰富的蛋白序列及结构信息
- PDB存储了丰富的蛋白3D结构信息
- 通过两者的结合，我们可以对蛋白功能进行进一步深入的理解
